jQuery Animation Lab

1. Open the Animation lab folder.

Making a menu that slides in
You've seen on certain web pages (particularly on mobile pages) where we have a menu that slides in when the user taps on it or hovers over it. We're going to make that happen in this lab.

2. Look at animate.html
3. Right now it doesn't respond to any events but on the left you can see a <div> peaking out. When the user mouses over that div it should slide out so its contents can be seen.
4. Add an event handler that does this:
    a. When the user hovers over the div, it slides out so we can see it. (hint: you'll want to animate its 'left' css property).
    b. When the mouse leaves it, it should slide back to its original position.

Revealing content on click
Similarly we'd like to be able to see some content based on a button click. When the user clicks a button we want to reveal some content and when he/she clicks it again, we'd like to hide it again.

5. Look at signup.html. Notice that there is a <div> which starts out hidden.
6. See the login button at the top? The div containing the userid/password should slide down when the user clicks on it. Using jQuery, make that happen.
7. Run and test. Does the <div> show on the button's click? If so, you can move on.
8. Now make it slide up when the user clicks it again.
